

Stop rereading contract notices

I built a system that checks updated government opportunities, ignores meaningless reissues, and shows a business which changes need attention.

The client problem

Government contract websites may publish several versions of the same opportunity. A business can waste time reopening every version even when the deadline, value, status, and eligibility details have not changed.

7

versions in one live notice

6

versions labeled as updates

0

important changes in those updates

1

real cancellation found

CASE 1 | SIX FALSE ALARMS REMOVED

The source called six versions updates. The system compared the details a contractor cares about and found that **nothing important changed**. All six were removed from the action list.

CASE 2 | REAL CANCELLATION FOUND

A second notice actually changed: it was cancelled, its deadline and value disappeared, and its work package closed. The system found **five important changes** and sent it for review.

What the client receives

- A short list of opportunities that actually changed
- An ignore list showing why an update was dismissed
- A review list when the source does not provide enough information
- Downloadable results that can feed email, a CRM, or a spreadsheet

From a crowded update feed to a short action list

The system follows four understandable steps. The client's business rules remain editable instead of being hidden inside an AI prompt.

Rules a client can customize

Contract category

Closing-date window

Work-package status

Minimum and maximum value

Opportunity status

Required information

Why there are three output lists

Act: something important changed and the opportunity still fits.

Ignore: nothing useful changed, or the opportunity does not fit.

Review: something changed, but the source is missing information needed for a safe decision.

Every result explains itself

- what changed, including old and new values
- why the opportunity was accepted or rejected
- which information was missing
- where and when the source data was retrieved
- a fingerprint proving which source version was used

What I built and proved

The demonstration uses both repeatable test cases and two real public contract records. The technical evidence is available for a client or engineering reviewer to inspect.

Plain-English verification

CLIENT QUESTION	HOW TESTED	RESULT
Can it remove meaningless updates?	6 live updates	Yes - all 6 ignored
Can it find a real cancellation?	1 live cancellation	Yes - 5 changes found
Will it guess when details are missing?	Live missing data	No - sent to review
Can saved data be processed again?	Automated replay	Yes - same result
Are contact details kept out?	Automated privacy check	Yes - excluded
Do the repeatable tests pass?	7 automated tests	Yes - 7 of 7

WHAT THIS DEMO IS

A working example of contract-update monitoring, business-rule filtering, privacy-conscious data handling, explainable decisions, and downloadable results. The code, tests, sanitized samples, and results are included.

WHAT IT IS NOT YET

It is not an always-on hosted service. Scheduling, dashboards, email or CRM delivery, document comparison, and production-scale monitoring would be configured around a client's sources and workflow.

Technical handoff

Python | Find a Tender OCDS API | Rule-based filtering | JSON + CSV | 7 automated tests
